## Digoxin

Find the answers to the following questions for a 45 year old, 60 kg woman with a serum creatinine of 0.1 mmol/L (Patient A):

The target concentration of digoxin for the treatment of atrial fibrillation is 1 ng/mL. Tablets of digoxin contain 62.5 micrograms and 250 micrograms (mcg).

A. What loading dose is required?

Slide 6

## Digoxin

Parameter	Value
F (oral)	0.65
V Liters	490
CLr L/h	CLcr
CLh L/h	3

Typical values for a 70 kg person

Slide  
7

## Digoxin PK

Patient A  
Age= 45 y Wt= 60 kg Sex= F Screat = 0.10 mmol/l

$$V = 490 \text{ L} \times 60/70 \text{ kg} = 420 \text{ L}$$

Slide  
8

## Digoxin Loading Dose

Patient A  
Age= 45 y Wt= 60 kg Sex= F Screat = 0.10 mmol/l

$$\begin{aligned} \text{TC} &= 1 \text{ mcg/L} \\ V &= 420 \text{ L} \end{aligned}$$

$$\begin{aligned} \text{LDiv} &= \text{TC} \times V \\ &= 1 \text{ mcg/L} \times 420 \text{ L} \\ &= 420 \text{ mcg iv} \end{aligned}$$

$$\begin{aligned} \text{LDor} &= \text{LDiv} / F \\ &= 420 \text{ mcg} / 0.65 \\ &= 646 \text{ mcg oral (rapid absorption rate formulation)} \\ &= 0.625 \text{ mg ( 2 x 250 mcg + 2 x 62.5 mcg)} \end{aligned}$$

## Digoxin

Find the answers to the following questions for a 45 year old, 60 kg woman with a serum creatinine of 0.1 mmol/L (Patient A):

The target concentration of digoxin for the treatment of atrial fibrillation is 1 ng/mL. Tablets of digoxin contain 62.5 micrograms and 250 micrograms (mcg).

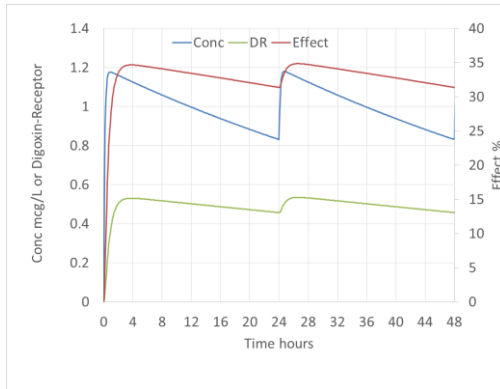

A. What loading dose is required?

B. What maintenance dose is required?

<p>Slide 10</p>	<h2 style="text-align: center; color: red;">Creatinine Clearance Prediction</h2> $CL_{cr} (L/h) = \frac{160 - Age(y)}{250 \bullet S_{cr}(mmol/L)} \bullet \frac{Wt(kg)}{70}$ <p style="text-align: center;">• 0.9 if Female</p> <p>e.g. 60 year old, 140 Kg male with Scr 0.1 mmol/L:</p> $CL_{cr} (L/h) = \frac{160 - 60y}{250 \bullet 0.1mmol/L} \bullet \frac{140kg}{70} = 8L/h$	<p>This formula is based on Bjornsson (1979). It incorporates and updates the data originally collected and published by Cockcroft &amp; Gault.</p> <p>Bjornsson TD. Use of serum creatinine concentrations to determine renal function. Clin Pharmacokinet. 1979;4(3):200-22. Cockcroft DW, Gault MH. Prediction of creatinine clearance from serum creatinine. Nephron. 1976;16:31-41.</p>
<p>Slide 11</p>	<h2 style="text-align: center; color: red;">Digoxin PK</h2> <p>Patient A Age= 45 y Wt= 60 kg Sex= F Screat = 0.10 mmol/l</p> <p>V = 490 L x 60/70 kg = 420 L</p> <p>CLh = 3.0 L/h x 60/70 kg = 2.57 L/h</p> <p>CLr = CLcr = (160 - 45 y) / (250 x 0.1 mmol/L) x 60/70 kg x 0.9 = 3.55 L/h</p> <p>CLt = CLh + CLr = 2.57 + 3.55 = 6.12 L/h</p> <p>T1/2= 0.7 x 420 L / 6.12 L/h = 48.04 h</p>	
<p>Slide 12</p>	<h2 style="text-align: center; color: red;">Digoxin Maintenance Dose</h2> <p>Patient A Age= 45 y Wt= 60 kg Sex= F Screat = 0.10 mmol/l</p> <p>TC = 1 mcg/L CLt = 6.12 L/h</p> <p>MDRiv= TC x CL = 1 mcg/L x 6.12 L/h = 6.12 mcg/h iv</p> <p>MDRor= MDRiv / F = 6.12 mcg/h / 0.65 = 9.42 mcg/h oral</p> <p>MD = 9.42 mcg/h x 24 h = 226 mcg every 24h = 0.25 mg once a day</p>	

Slide 13

## Digoxin LD + MD

Combining a loading dose with a maintenance dose rapidly achieves plasma concentrations similar to those at steady state. The bound receptor concentration (DR) is delayed which explains why the effect of digoxin is delayed.

Slide 14

## Theophylline

Find the answers to the following questions for a 5 year old, 20 kg girl with a serum creatinine of 0.1 mmol/L (Patient B):

The target concentration for theophylline for the treatment of bronchoconstriction is 10 mg/L. Tablets of theophylline contain 250 mg. An elixir contains 80 mg/15 mL. Hint: Adult age and renal function do not influence V or CL for theophylline.

- A. What is the predicted volume of distribution?
- B. What is the predicted clearance?

Slide 15

## Theophylline

<i>Parameter</i>	<i>Value</i>
F (oral)	1
V Liters	35
CLr L/h	0
CLh L/h	2.8

Typical values for a 70 kg person

Slide  
16

## Theophylline PK

Patient B  
Age= 5 y Wt= 20 kg Sex= F Screat = 0.10 mmol/l

$$V = 35 \text{ L} \times 20/70 \text{ kg} = 10 \text{ L}$$

$$\text{CLh} = 2.8 \text{ L/h} \times (20/70)^{3/4} \\ = 1.1 \text{ L/h}$$

$$\text{CLr} = 0 \text{ L/h}$$

$$\text{CLt} = \text{CLh} + \text{CLr} \\ = 1.1 + 0 = 1.1 \text{ L/h}$$

$$T_{1/2} = 0.7 \times 10 \text{ L} / 1.1 \text{ L/h} = 6.3 \text{ h}$$

Rule of PNA predicts 1/3 of adult dose for 19 kg 5 year old child which means 1/3 of adult clearance ( $2.8 \text{ L/h} \times 1/3 = 0.93 \text{ L/h}$ )

Slide  
17

## Rules of PNA and PMA

Fraction of adult maintenance dose

Typical Weight Kg	PMA or PNA	Fraction Adult Dose	Rule of PMA+PNA Error	'true' % Adult Dose
1	25 weeks	1/300	10%	0.3
1	30 weeks	1/120	1%	0.8
3	Full Term	1/30	1%	3.3
6	3 mo	1/10	8%	9.3
7	6 mo	1/6	24%	13.4
9	1 year	1/5	3%	19.5
12	2 years	1/4	-4%	26.1
19	5 years	1/3	-11%	37.4
34	10 years	1/2	-14%	58.5
50	15 years	3/4	-3%	77.4
70	Adult	1		100.0

Weight is combined with post-natal age (PNA) and post-menstrual age (PMA) to predict the typical dose as a % of the adult dose. The coloured areas of the table show the fraction of adult maintenance dose that would be expected for infants and children. The fractions are based on the theoretical size and maturation model for typical drug clearance with some approximation to make the numbers easier to remember. The 'rule of PMA+PNA' has an acceptable error for clinical dose prediction. Although maturation is best described by a non-linear relationship it is quite well approximated by a linear function of PMA.

B. What is the predicted clearance? C. What loading dose is required? D. What maintenance dose is required?</p>	
<p>Slide 21</p>	<h2 style="text-align: center; color: red;">Theophylline Maintenance Dose</h2> <p>Patient A Age= 5 y Wt= 20 kg Sex= F Screat = 0.10 mmol/L</p> <p>TC = 10 mg/L CLt = 1.1 L/h</p> <p>MDRiv= TC x CL = 10 mg/L x 1.1 L/h = 11 mg/h iv</p> <p>MDRor= MDRiv/F = 11 mg/h / 1.0 = 11 mg/h oral</p> <p>MD = 11 mg/h x 6 h = 66 mg every 6h = 10 mL 4 times a day (53 mg)</p>	<p>Rule of PNA predicts 1/3 of adult dose for 19 kg 5 year old child which means MDRiv=10 mg/L*0.93=9.3 mg/h = MD 55.8 mg/6h</p>

Slide 22

If theophylline is started with a loading dose the concentration and effect are close to the steady state and this is achieved with the first dose.

Slide 23

### Cimetidine

The target concentration of cimetidine for the treatment of peptic ulceration is 1 mg/L.

A. What IV loading dose is required?

B. What IV infusion rate is required?

Slide 24

### Cimetidine

<i>Parameter</i>	<i>Value</i>
F (oral)	0.6
V Liters	150
CLr L/h	7 x CLcr
CLh L/h	10

Typical values for a 70 kg person

Slide  
25

## Cimetidine PK

Patient A  
Age= 45 y Wt= 60 kg Sex= F Screat = 0.10 mmol/l

$$V = 150 \text{ L} \times 60/70 \text{ kg} = 128.57 \text{ L}$$

$$\begin{aligned} \text{CLh} &= 10 \text{ L/h} \times 60/70 \text{ kg} \\ &= 8.57 \text{ L/h} \end{aligned}$$

$$\begin{aligned} \text{CLr} &= 7 \times \text{CLcr} \\ &= 7 \times (160 - 45 \text{ y}) / (250 \times 0.1 \text{ mmol/L}) \times 60/70 \text{ kg} \times 0.9 \\ &= 24.85 \text{ L/h} \end{aligned}$$

$$\begin{aligned} \text{CLt} &= \text{CLh} + \text{CLr} \\ &= 8.57 + 24.85 = 33.42 \text{ L/h} \end{aligned}$$

$$T_{1/2} = 0.7 \times 128.57 \text{ L} / 33.42 \text{ L/h} = 2.69 \text{ h}$$

Slide  
26

## Cimetidine Loading Dose and Infusion

Patient A  
Age= 45 y Wt= 60 kg Sex= F Screat = 0.10 mmol/l

$$\text{TC} = 1.0 \text{ mg/L}$$

$$V = 128.57 \text{ L}$$

$$\text{CL} = 33.42 \text{ L/h}$$

$$\begin{aligned} \text{IV Loading Dose} &= V \times \text{TC} \\ &= 128.57 \text{ L} \times 1.0 \text{ mg/L} \\ &= 128.57 \text{ mg} \end{aligned}$$

$$\begin{aligned} \text{IV Infusion Rate} &= \text{CL} \times \text{TC} \\ &= 33.42 \text{ L/h} \times 1.0 \text{ mg/L} \\ &= 33.42 \text{ mg/h} \end{aligned}$$

Slide  
27

## Cimetidine

The target concentration of cimetidine for the treatment of peptic ulceration is 1 mg/L.

A. What IV loading dose is required?

B. What IV infusion rate is required?

C. What concentration would be reached 12 hours after starting an infusion? (no loading dose)

## Cimetidine 12 h Concentration

Concentration can be estimated from the expected steady state concentration (1.0 mg/L) and the approximate number of half-lives (2.69 h) that the infusion has continued.

At 3 h ( 1.0 T1/2s; 50% Css) = 0.50 mg/L  
At 5 h ( 2.0 T1/2s; 75% Css) = 0.75 mg/L  
At 11 h ( 4.0 T1/2s; 94% Css) = 0.94 mg/L  
At 22 h ( 8.0 T1/2s;100% Css) = 1.00 mg/L

A more precise prediction uses an INFUSION input model:

At 3 h ( 1.1 T1/2s; 54% Css) = 0.54 mg/L  
At 12 h ( 4.5 T1/2s; 96% Css) = 0.96 mg/L  
At 24 h ( 8.9 T1/2s;100% Css) = 1.00 mg/L
